

CLAIM AMENDMENT

1 - 26. (canceled)

1 27. (new) An adapter fittable with a power track having
2 grooves holding conductors, the adapter comprising:

3 a first dielectric housing shell;

4 webs on the first shell forming a journal;

5 a control shaft fittable and rotatable in the journal and
6 having a retaining surface;

7 means including an elastically deformable formation on
8 the first shell engageable with the retaining surface for
9 releasably retaining the shaft in the journal;

10 a second dielectric housing shell fittable with the first
11 shell; and

12 means for securing the shells together with the shaft
13 between them.

1 28. (new) The power-track adapter defined in claim 27
2 wherein the formation is a fork having a pair of elastically
3 deformable arms between which the shaft is resiliently held and
4 between which the shaft can rotate.

1 29. (new) The power-track adapter defined in claim 27
2 wherein the retaining formation is two such forks.

1 30. (new) The power-track adapter defined in claim 27,
2 further comprising
3 a hinge between the shells.

1 31. (new) The power-track adapter defined in claim 30
2 wherein the hinge is a membrane shell unitarily formed with the
3 first and second shells.

1 32. (new) The power-track adapter defined in claim 27
2 wherein the second shell has a retaining surface, the adapter
3 further comprising
4 a retaining formation on the first shell and snugly
5 engageable with the retaining surface of the second shell.

1 33. (new) The power-track adapter defined in claim 32
2 wherein the retaining formation of the first shell is a spring
3 tongue having a hook end, the second shell being formed with a
4 throughgoing aperture immediately adjacent the respective retaining
5 surface, the shells being fittable together with the hook end
6 engaging through the aperture and locking on the retaining surface
7 of the second shell.

1 34. (new) The power-track adapter defined in claim 32
2 wherein the retaining formation of the first shell is unitarily
3 formed with the first housing shell.

1 35. (new) The power-track adapter defined in claim 34
2 wherein the retaining formation of the first shell is elastically
3 deformable.

1 36. (new) The power-track adapter defined in claim 27
2 wherein the control shaft can rotate freely in the journal.

1 37. (new) An adapter adapted to fit with a power track
2 having grooves holding conductors, the adapter comprising:
3 a first dielectric housing half shell;
4 a second dielectric housing half shell fittable with the
5 first half shell and having a retaining surface;
6 formations on the half shells forming a journal;
7 a control shaft fittable in the journal between the half
8 shells; and
9 a retaining formation on the first half shell latchingly
10 engageable with the retaining surface of the second half shell.

1 38. The power-track adapter defined in claim 37 wherein
2 the two housing half shells together form a substantially closed
3 chamber containing the shaft.

1 39. (new) The power-track adapter defined in claim 37
2 wherein the journal-forming formations are webs unitarily formed
3 with the half shells and forming generally semicircular seats that
4 in turn form the journal.

1 40. (new) An adapter adapted to fit with a power track,
2 the adapter comprising:
3 a first dielectric housing shell;
4 a second dielectric housing shell fittable with the first
5 shell and having a retaining surface and formed with a throughgoing
6 hole adjacent the retaining surface;
7 a control shaft fittable between the shells and having a
8 retaining surface; and
9 a retaining formation on the first shell and latchingly
10 engageable through the hole with the retaining surface of the first
11 shell.

1 41. (new) An adapter adapted to fit with a power
2 track, the adapter comprising:
3 a first dielectric housing shell;
4 a second dielectric housing shell fittable with the first
5 shell and having a retaining surface;
6 a membrane hinge unitarily formed with and pivotally
7 interconnecting the housing shells;
8 a control shaft fittable between the shells; and

9 a retaining formation on the first shell and snugly
10 engageable with the retaining surface of the second shell.
